SECURITY & RISK INTELLIGENCE AUDIT REPORT

Project: SCOTTY PUMPKIN (SPUMP)

Network: Solana (SPL Token – Token-2022)

Version: 2.0 (Premium)

1. Executive Dashboard

Security Score: 78 / 100

Risk Level: Moderate

Estimated Financial Exposure: Medium (liquidity and governance risks)

Audit Grade: B

2. Executive Summary

This premium audit evaluates technical, financial, governance, and infrastructure risks.

The project shows strong architecture but has centralization and economic exposure risks.

3. Scope

Website: <https://scottypumpkin.com>

GitHub: <https://github.com/SPUMP-COIN>

Tokenomics and governance reviewed

Backend not fully audited (limited visibility)

4. Methodology

Static code and architecture review

Tokenomics modeling

Governance analysis

Attack scenario simulation

Risk scoring framework

5. Findings Summary

Centralization risk (80% locked supply)

Off-chain dependency risk

Token release pressure risk

Governance transparency gap

6. Detailed Findings

F1: Supply concentration → Medium-High Risk

F2: Off-chain control logic → Medium Risk

F3: Vesting schedule pressure → Medium Risk

F4: Governance centralization → Medium Risk

7. Attack Simulation

Scenario A: Liquidity drain → possible rapid price collapse

Scenario B: Vesting dump → sustained sell pressure

Scenario C: Backend compromise → premature token release

Scenario D: Governance capture → full control risk

8. Financial & Economic Analysis

Tokenomics dependent on demand growth

Treasury concentration risk

Inflation pressure from release schedule

Liquidity sensitivity high

9. Infrastructure Review

Backend (Go) introduces centralized risk

API and wallet integrations assumed external

Limited visibility reduces assurance

10. Governance & Control

Multisig planned (Squads)

No enforced decentralization thresholds

Admin role risks present

11. Score Breakdown

Code Security: 85

Infrastructure: 70

Financial Risk: 65

Governance: 75

12. Recommendations

Implement on-chain vesting controls

Increase treasury transparency

Strengthen multisig governance

Introduce real-time monitoring dashboard

Reduce centralization risk over time

13. Conclusion

Project is viable but requires structural improvements before scaling.

Primary risks are financial and governance-based rather than code-level.

14. Disclaimer

This audit reflects a point-in-time assessment.

No guarantee of absence of vulnerabilities.

Not financial advice.
